NAME

rrdflushcached − Flush the values for a specific RRD file from memory.

SYNOPSIS

rrdtool flushcached [**−−daemon**|**−d** *address*] *filename* [*filename ...*]

DESCRIPTION

The **flushcached** function connects to rrdcached, the RRD caching daemon, and issues a ''flush'' command for the given files. The daemon will put the files to the head of the update queue so they are written ''soon''. The status will be returned only after the files' pending updates have been written to disk.

filename   The name(s) of the **RRD** file(s) that are to be written to disk.

−−daemon|**−d** *address*

Address of the rrdcached daemon. If not specified, the RRDCACHED_ADDRESS environment variable must be set (see below). For a list of accepted formats, see the **−l** option in the rrdcached manual.

        rrdtool flushcached --daemon unix:/var/run/rrdcached.sock /var/lib/rrd/foo

ENVIRONMENT VARIABLES

The following environment variables may be used to change the behavior of `rrdtool flushcached`:

RRDCACHED_ADDRESS

If this environment variable is set it will have the same effect as specifying the `--daemon` option on the command line. If both are present, the command line argument takes precedence.
